Model / Baseline	Mean Absolute Error (MAE)
Mean Baseline	10.32 minutes
Median Baseline	10.33 minutes
Linear Regression	1.92 minutes

The 70/30 split with seed 7 increased the MAE to approximately 2.10, but the model still drastically outperforms the guessing baseline, leaving the overall conclusion unchanged. This variance of nearly 0.2 minutes demonstrates that the exact score of a single train/test split depends heavily on the random assignment of data points, meaning a single split's metric cannot be fully trusted as the absolute performance of the model.
