Model Choice Justification I would deploy the Linear Regression model for this delivery time prediction task. It achieved the lowest cross-validated Mean Absolute Error of 2.03 minutes and offers superior explainability, allowing us to easily interpret the coefficients to explain predictions to restaurant owners. By choosing this simple approach, we accept the trade-off of potentially missing out on complex, non-linear patterns in messier real-world data in exchange for a model that trains in milliseconds and requires almost no memory.
